AT LAST! AN ORCHID ANYONE CAN GROW ANYWHERE.

The Egret Flower

SEND YOUR ORDER NOW AND AVOID DISAPPOINTMENT

Habenaria radiata is a deciduous terresrial orchid from the orient, and grows from small bulbs about the size of a bean. The glistening pure white flowers are held on stems twelve to fifteen inches high. Each stem carries two to five flowers one to two inches in diameter. The long green spurs add much to the attractiveness of the flowers. The feature of the flower is the fringed edges of the lip which gives the flower the appearance of a crane in flight. The individual flowers are long-lasting. All in all, it is a very pretty flower.

The plant is extremely hardy and will survive sub-zero weather, but will grow equally well in our South-ern climates or in a glass house. Packed moist, the bulbs will keep for many months in a refrigerator, and may be planted monthly in order to have flowers nearly all the year. It may be planted in almost any media, such as ordinary garden soil, peat and sand mixture, Cymbidium or Cypripedium mixture, sphagnum moss or leafmold. If planted in moss, it must be fed regul-arly, otherwise treat it like any other plant in your garden or house. The one most important cultural point is never to let it go dry. It must be kept moist at all times. We recommend six bulbs to a four inch pot.

Use it as a house plant, glasshouse plant, lath-house plant, garden plant — in fact anywhere where there is half shade or full sunlight and sufficient mois-ture. We are making the price so attractively low that you will want to plant it by the hundred. We are now accepting orders for delivery after December first. We will gladly send it as your Christmas gift to your friends.
